## **Appendix Text 1.** Data management.

We used a database on cardiometabolic risk factors collated by the Non-Communicable Disease Risk Factor Collaboration (NCD-RisC). Data were obtained from publicly available multi-country and national measurement surveys (e.g., Demographic and Health Surveys (DHS), WHO-STEPwise approach to Surveillance (STEPS) surveys, and those identified via the Inter-University Consortium for Political and Social Research, UK Data Service, and European Health Interview & Health Examination Surveys Database). With the help of World Health Organization (WHO) and its regional and country offices as well as World Heart Federation, we identified and accessed population-based survey data from national health and statistical agencies. We searched and reviewed published studies as detailed previously<sup>1</sup> and invited eligible studies to join NCD-RisC, as did we with data holders from earlier pooled analysis of cardiometabolic risk factors.<sup>2-5</sup>

We carefully checked that each data source meets our inclusion criteria listed below. Potential duplicate data sources were first identified by comparing studies from the same country and year, followed by checking with NCD-RisC members that had provided data about whether the sources from the same country and year were the same or distinct. If two sources were confirmed as duplicates, one was discarded. All NCD-RisC members are also periodically asked to review the list of sources from their country, to verify that the included data meet the inclusion criteria and are not duplicates, and to suggest additional sources. The NCD-RisC database is continuously updated through all the above routes. For each data source, we recorded the study population, sampling approach, years of measurement, and measurement methods. Only population-based data were included, and these were assessed in terms of whether they covered the whole country, multiple sub-national regions, or one or a small number of communities, and whether rural, urban, or both participants were included. All submitted data were checked by at least two independent persons. Questions and clarifications were discussed with NCD-RisC members and resolved before data were incorporated in the database.

Anonymised individual data for participants aged 30 to 79 years from the studies in the NCD-RisC database were reanalysed according to a standardised protocol for 1,157 of the 1,201 studies. We calculated the prevalence of hypertension (as defined in the main paper) and the proportion of people with hypertension who reported a prior hypertension diagnosis, who were taking medication for hypertension and whose blood pressure was controlled, and the associated standard errors by sex and ten-year age groups from 30 to 79 years. We also calculated the proportion of people with hypertension who untreated stage 2 hypertension. All analyses incorporated sample weights and complex survey design, when applicable, in calculating summary statistics, with computer code provided to NCD-RisC members who requested assistance.

Additionally, summary statistics for nationally representative data from sources that were identified but not accessed via the above routes were extracted from published reports. Data were also extracted for two STEPS surveys that were not publicly available. We also included those data from a previous global-data pooling study,<sup>2</sup> when not accessed through the above routes.

We excluded <0.1% of all participants who had implausible systolic blood pressure (defined as <70 mmHg or >270 mmHg) or diastolic blood pressure (<30 mmHg or >150 mmHg). 0.2% of participants reported previous diagnosis with hypertension, were not using medicines, and had blood pressure below 140/90 mmHg. This phenomenon was more common among young adults aged 30-49 years. We assigned them to not having hypertension on the premise that either their hypertension was controlled through lifestyle modification, or their answer may reflect misreporting of general advice about their blood pressure as having had a diagnosis of hypertension.

## Appendix Text 2. Statistical methods.

We used a Bayesian hierarchical model to estimate the primary outcomes. The model was applied separately to estimate the following metrics for men and women by country, year, and age: (1) prevalence of hypertension, and the proportion of people with hypertension (2) who reported a prior hypertension diagnosis, (3) who were taking medication for hypertension, (4) whose blood pressure was controlled, and (5) who had untreated stage 2 hypertension. The model is described in detail in statistical<sup>6</sup> and related substantive papers,<sup>1,2</sup> and the computer code for the model is available at [www.ncdrisc.org](http://www.ncdrisc.org).

In summary, the model had a hierarchical structure in which estimates for each country and year were informed by their own data, if available, and by data from other years in the same country and from other countries, especially those in the same region and super-region, with data for similar time periods. The extent to which estimates for each country-year were influenced by data from other years and other countries depended on whether the country had data, the sample size of the data, whether they were nationally representative, and the within-country and within-region variability of the available data. For the purpose of hierarchical analysis, countries were organised into 21 regions, mostly based on geography and national income. Regions were in turn organised into nine super-regions (Appendix Table 2).

The statistical model included terms that allowed non-linear time trends, specified through a combination of a linear slope and a second order random walk,<sup>7</sup> both modelled hierarchically. We used a cubic spline to allow non-linear age associations. We used a cubic spline model with one knot at 55 years, the mid-point of 30-79-year age range of our study. The mid-age  $z_h$  of age group  $h$  in study  $i$  was used to calculate the age model term  $\gamma_i$ :

$$\gamma_i(z_h) = \gamma_{1i}z_h + \gamma_{2i}z_h^2 + \gamma_{3i}z_h^3 + \gamma_{4i}(z_h - 55)_+^3$$

We adapted the age model that was used in previous NCD-RisC papers<sup>1,2,6</sup> to allow time trends to be different by age. We made this modification because how each of our primary outcomes has changed over time may vary by age.<sup>8,9</sup> Age-dependent trends were specified by interactions with time in the age model. Specifically, each of the spline coefficients ( $\gamma_{ki}$ ;  $k = 1, 2, 3, 4$ ) was allowed to vary both across countries and (linearly) over time, with a hierarchical structure using the equation below, where  $t$  is the year study  $i$  was conducted;  $\psi$  is the global intercept;  $\phi$  is the global slope;  $c$ ,  $r$ ,  $s$  are the country, region and super-region random intercepts, respectively;  $\omega^c$ ,  $\omega^r$ ,  $\omega^s$  are the country, region and super-region random slopes, respectively; and  $j[i]$  is the index of the country study  $i$  was from,  $l[i]$  is its region, and  $m[i]$  is its super-region. We tested models with and without interaction of age and time, including those with time interactions at a subset of hierarchies or for intercepts only. We selected the following model based on Watanabe-Akaike information criterion and visual inspection of results.

$$\gamma_{ki} = \psi_k + \phi_k t_i + c_{kj[i]} + r_{kl[i]} + s_{km[i]} + \omega_{kj[i]}^c t_i + \omega_{kl[i]}^r t_i + \omega_{km[i]}^s t_i$$

The statistical model also accounted for the possibility that hypertension prevalence, diagnosis, treatment and control in sub-national and community samples might differ systematically from nationally representative samples and have larger variation than in national studies. These features were implemented by including data-driven fixed-effect and random-effect terms for sub-national and community data. The fixed effects adjusted for systematic differences between sub-national or community studies and national studies. The random effects allowed national data to have greater influence on the estimates than sub-national or community data with similar sample sizes. Finally, the model accounted for rural-urban differences in the primary outcomes, through the use of fixed effects for rural-only and urban-only studies. These rural and urban fixed effects were weighted by the difference between the study-level and the country-level shares of population living in cities versus rural areas in the year in which the study was done. Data on the proportion of population who live

in urban areas were from the World Urbanization Prospects (2018 revision).<sup>10</sup> The statistical details of the model and the evaluation of its performance are provided in a statistical paper<sup>6</sup> and the appendix of a previous substantive paper.<sup>2</sup>

All analyses were done separately by sex because men and women in the same country can have different levels and trends in hypertension prevalence, diagnosis, treatment and control.<sup>11-13</sup> We fitted the statistical model using Markov chain Monte Carlo (MCMC) implemented in the R programming language.<sup>14</sup> We obtained 50,000 post-burn-in samples (or draws) from the posterior distribution of model parameters. We kept every 10<sup>th</sup> sample, resulting in 5,000 samples that were in turn used to obtain the posterior distributions of hypertension prevalence, diagnosis, treatment and control. Posterior estimates were made in five-year age groups from 30 to 79 years of age for every year from 1990 to 2019. The uncertainty of the model estimates, represented by their posterior distributions, incorporate: the sampling uncertainty of the data sources used in the study; uncertainty associated with fluctuations in national data because of unmeasured study design and implementation factors that lead to variability beyond that of sampling; additional uncertainty associated with data sources that were not national, because of subgroup variation within each country; and uncertainty due to use of a model to estimate prevalence or proportion by age group, country, and year when data were missing.

We analysed each primary outcome separately. The estimated posterior mean of diagnosis was lower than that of treatment in <0.4% of all country-year-sex-age groups (by an average of 1.8 percentage points); the estimated posterior mean of treatment was lower than that of control in 0.04% of all country-year-sex-age groups (by an average of 0.7 percentage point). In such situations, we adjusted the diagnosis and control rates so that diagnosis was not smaller than treatment and treatment was not smaller than control.

**Appendix Table 1.** Data sources used in the analysis. All studies had measured data on blood pressure and data on treatment.

\* Blood pressure measurement devices include:

Standard: standard mercury sphygmomanometer or aneroid sphygmomanometer; Random-zero: random-zero mercury sphygmomanometer; Digital: digital oscillometric device; Unknown: information unavailable or multiple types of devices used.

1. The first age group started from <30 years old and/or the last age group ended ≥80 years, but had a mean age of 30-79 years.

2. National studies for the 3 years prior to 1990 were assigned to 1990 so that they can inform the estimates in countries with slightly earlier national data.

3. This research uses data from Australia Health Survey (AHS). We thank the Health Section, Australian Bureau of Statistics, Belconnen, ACT, Australia for support for AHS 2011-2012.

4. This research uses data from China Health and Nutrition Survey (CHNS). We thank the National Institute of Nutrition and Food Safety, China Center for Disease Control and Prevention, Carolina Population Center (5 R24 HD050924), the University of North Carolina at Chapel Hill, the NIH (R01 HD30880, DK056350, R24HD050924, and R01 HD38700) and the Fogarty International Center, NIH for financial support for the CHNS data collection and analysis files from 1989 to 2011 and future surveys, and the China Japan Friendship Hospital, Ministry of Health for support for CHNS 2009.

5. The bibliographic citation for this data source is: Pelaez, Martha, Alberto Palloni, Cecilia Albala, Juan C. Alfonso, Roberto Ham-Chande, Anselm Hennis, Maria Lucia Lebrao, Esther Lesn-Diaz, Edith Pantelides, and Omar Prats. SABE - SURVEY ON HEALTH, WELL-BEING, AND AGING IN LATIN AMERICA AND THE CARIBBEAN, 2000 [Computer file]. ICPSR version. Washington, D.C.: Pan American Health Organization/World Health Organization (PAHO/WHO) [producers], 2004. Ann Arbor, MI: Inter-university Consortium for Political and Social Research [distributor], 2005.

6. The authors thank the Heinz Nixdorf Foundation [Chairman: Martin Nixdorf; Past Chairman: Dr jur. Gerhard Schmidt], for their generous support of this study. Parts of the study were also supported by the German Research Council (DFG) [DFG project: EI 969/2-3, ER 155/6-1;6-2, HO 3314/2-1;2-2;2-3;4-3, INST 58219/32-1, JO 170/8-1, KN 885/3-1, PE 2309/2-1, SI 236/8-1;9-1;10-1.], the German Ministry of Education and Science [BMBF project: 01EG0401, 01GI0856, 01GI0860, 01GS0820\_WB2-C, 01ER1001D, 01GI0205], the Ministry of Innovation, Science, Research and Technology, North Rhine-Westphalia (MIWFT-NRW), the Else Kröner-Fresenius-Stiftung [project: 2015\_A119] and the German Social Accident Insurance [DGUV project: FF-FP295]. Furthermore the study was supported by the Competence Network for HIV/AIDS, the deanship of the University Hospital and IFORES of the University Duisburg-Essen, the European Union, the German Competence Network Heart Failure, Kulturstiftung Essen, the Protein Research Unit within Europe (PURE), the Dr. Werner-Jackstädt Stiftung and the following companies: Celgene GmbH München, Imatron/GE-Imatron, Janssen, Merck KG, Philips, ResMed Foundation, Roche Diagnostics, Sarstedt AG&Co, Siemens HealthCare Diagnostics, Volkswagen Foundation. The authors express their gratitude to all study participants of the Heinz Nixdorf Recall (HNR) Study, the personnel of the HNR study center and the EBT-scanner facilities, the investigative group and all former employees of the HNR study. The authors also thank the Advisory Board of the HNR Study: T. Meinertz, Hamburg, Germany (Chair); C. Bode, Freiburg, Germany; P.J. de Feyter, Rotterdam, Netherlands; B. Güntert, Hall i.T., Austria; F. Gutzwiller, Bern, Switzerland; H. Heinen, Bonn, Germany; O. Hess (†), Bern, Switzerland; B. Klein (†), Essen, Germany; H. Löwel, Neuherberg, Germany; M. Reiser, Munich, Germany; G. Schmidt (†), Essen, Germany; M. Schwaiger, Munich, Germany; C. Steinmüller, Bonn, Germany; T. Theorell, Stockholm, Sweden; and S.N Willich, Berlin, Germany.

7. The Older Persons in Jamaica Study was funded by the National Health Fund, Jamaica.

8. The Longitudinal Aging Study Amsterdam is supported by a grant from the Netherlands Ministry of Health Welfare and Sports, Directorate of Long-Term Care. The data collection in 2012-2013 and 2013-2014 was financially supported by the Netherlands Organization for Scientific Research (NWO) in the framework of the project "New Cohorts of young old in the 21st century" (file number 480-10-014).

9. The British Women's Heart and Health Study is supported by the British Heart Foundation (PG/13/66/30442). British Women's Heart and Health Study data are available to bona fide researchers for research purposes. Please refer to the BWHHS data sharing policy at <http://www.ucl.ac.uk/british-womens-heart-health-study>.

10. Prof Stephen Fortmann contributed data from the Stanford Five-City Project.

**Appendix Table 2.** List of analysis regions and “super-regions”, and countries in each region.

The hierarchical structure of the statistical model consisted of country, region, super-region, and world.

Super-region	Region
<b>Sub-Saharan Africa (49)</b>	<b>Central Africa (6):</b> Angola, Central African Republic, Congo, DR Congo, Equatorial Guinea, Gabon
	<b>East Africa (18):</b> Burundi, Comoros, Djibouti, Eritrea, Ethiopia, Kenya, Madagascar, Malawi, Mauritius, Mozambique, Rwanda, Seychelles, Somalia, South Sudan, Sudan, Tanzania, Uganda, Zambia
	<b>Southern Africa (6):</b> Botswana, Eswatini, Lesotho, Namibia, South Africa, Zimbabwe
	<b>West Africa (19):</b> Benin, Burkina Faso, Cabo Verde, Cameroon, Chad, Cote d'Ivoire, Gambia, Ghana, Guinea, Guinea Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Sao Tome and Principe, Senegal, Sierra Leone, Togo
<b>Central Asia, Middle East and North Africa (28)</b>	<b>Central Asia (9):</b> Armenia, Azerbaijan, Georgia, Kazakhstan, Kyrgyzstan, Mongolia, Tajikistan, Turkmenistan, Uzbekistan
	<b>Middle East and North Africa (19):</b> Algeria, Bahrain, Egypt, Iran, Iraq, Jordan, Kuwait, Lebanon, Libya, Morocco, Occupied Palestinian Territory, Oman, Qatar, Saudi Arabia, Syrian Arab Republic, Tunisia, Turkey, United Arab Emirates, Yemen
<b>South Asia (6)</b>	<b>South Asia (6):</b> Afghanistan, Bangladesh, Bhutan, India, Nepal, Pakistan, Sri Lanka
<b>East and Southeast Asia (15)</b>	<b>East Asia (3):</b> China, North Korea, Taiwan
	<b>Southeast Asia (12):</b> Brunei Darussalam, Cambodia, Indonesia, Lao PDR, Malaysia, Maldives, Myanmar, Philippines, Thailand, Timor-Leste, Viet Nam
<b>Oceania (17)</b>	<b>Polynesia and Micronesia (13):</b> American Samoa, Cook Islands, French Polynesia, Kiribati, Marshall Islands, Micronesia (Federated States of), Nauru, Niue, Palau, Samoa, Tokelau, Tonga, Tuvalu
	<b>Melanesia (4):</b> Fiji, Papua New Guinea, Solomon Islands, Vanuatu
<b>High-income Asia Pacific (3)</b>	<b>High-income Asia Pacific (3):</b> Japan, Singapore, South Korea
<b>Latin America and Caribbean (35)</b>	<b>Andean Latin America (3):</b> Bolivia, Ecuador, Peru
	<b>Caribbean (18):</b> Antigua and Barbuda, Bahamas, Barbados, Belize, Bermuda, Cuba, Dominica, Dominican Republic, Grenada, Guyana, Haiti, Jamaica, Puerto Rico, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago
	<b>Central Latin America (9):</b> Colombia, Costa Rica, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Venezuela

	<b>Southern Latin America (5):</b> Argentina, Brazil, Chile, Paraguay, Uruguay
	<b>High-income English-speaking countries* (6):</b> Australia, Canada, Ireland, New Zealand, United Kingdom, United States of America
<b>High-income western (27)</b>	<b>North Western Europe (12):</b> Austria, Belgium, Denmark, Finland, Germany, Greenland, Iceland, Luxembourg, Netherlands, Norway, Sweden, Switzerland
	<b>South Western Europe (9):</b> Andorra, Cyprus, France, Greece, Israel, Italy, Malta, Portugal, Spain
<b>Central and Eastern Europe (20)</b>	<b>Central Europe (13):</b> Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Czechia, Hungary, Montenegro, North Macedonia, Poland, Romania, Serbia, Slovakia, Slovenia
	<b>Eastern Europe (7):</b> Belarus, Estonia, Latvia, Lithuania, Moldova, Russian Federation, Ukraine

\* Although high-income English-speaking countries are geographically separated, they exhibit remarkably similar trends in cardiometabolic risk factors and outcomes.<sup>1, 15-18</sup> They were therefore grouped together so that the statistical model shares information amongst them more than it does with other countries that are geographically closer but epidemiologically more distinct.

We did not have data on population by age group for American Samoa, Bermuda, Greenland, and Tokelau. Country-specific estimates were made but were not used in calculation of regional and global prevalences because the latter requires weighting by age-specific population.

**Appendix Table 3.** Estimated age-standardised prevalence of hypertension and proportions of people with hypertension who reported a diagnosis, who used treatment, and whose blood pressure was effectively controlled, by country in 2019. Numbers in parentheses are the 95% credible intervals.

<i>Women aged 30-79 years</i>	<b>Hypertension (%)</b>	<b>Detection/ awareness (%)</b>	<b>Treatment (%)</b>	<b>Control (%)</b>
<b>Central and Eastern Europe</b>				
<i>Central Europe</i>

**Appendix Table 4.** Status of hypertension risk factors, and policies and programmes related to hypertension prevention, detection, treatment and control in seven countries with high hypertension treatment rates.

Country	Factors related to hypertension prevention*	Factors related to hypertension detection, treatment and control
Canada	<ul style="list-style-type: none"> <li>- Mean BMI: 27 kg/m<sup>2</sup> in women and 27.5 kg/m<sup>2</sup> in men, an increase of 2-2.5 kg/m<sup>2</sup> since 1990.</li> <li>- Average sodium intake: ~3.7 g/day.</li> <li>- Availability of vegetables and of starchy roots and fruits increased since 1990.</li> <li>- Smoking prevalence: 12% in women and 17% in men, a 40-50% relative reduction since 2000.</li> </ul>	<ul style="list-style-type: none"> <li>- The healthcare system is funded through personal and corporate taxes.</li> <li>- 100% public insurance coverage for physician consultations and for drugs provided in hospitals. Payment needed for prescriptions. Private benefit plans cover varying proportions of prescriptions.</li> <li>- National effort to improve hypertension control is coordinated by the Canadian Hypertension Education Program (CHEP), started in 1999. CHEP included three workforces on recommendation, implementation and outcome evaluation. Key features in CHEP include: annual update of guidelines; tailored knowledge dissemination; and coordinated implementation and outcome evaluation.</li> <li>- Hypertension guidelines were first published in 1977 with annual update since 1999. Since 1993, guidelines recommended immediate treatment for people with BP ≥160/100 mmHg and recommended immediate treatment based on other risks for people with BP between 140/90 and 160/100 mmHg.</li> </ul>
Costa Rica	<ul style="list-style-type: none"> <li>- Mean BMI: 28 kg/m<sup>2</sup> in women and 27 kg/m<sup>2</sup> in men, an increase of 3.5 kg/m<sup>2</sup> in women and 2.5 kg/m<sup>2</sup> in men since 1990.</li> <li>- Average sodium intake: ~3.2 g/day.</li> <li>- Availability of vegetables and of starchy roots and fruits increased since 1990.</li> <li>- Smoking prevalence: 6% in women and 17% in men, a ~30% relative reduction since 2000.</li> </ul>	<ul style="list-style-type: none"> <li>- Healthcare system is funded by 70% public resources, 27% out of pocket spending, and 3% private insurance in 2010. Government covers children and pregnant women not covered through other means, retired people and homeless people.</li> <li>- Single-payer health system (CCSS) with universal lifetime coverage, serving 95% of the population and providing strong safety net for the poor. Low inequality in health service access and health outcomes nationally.</li> <li>- A wide nationwide network of primary care facilities organised in a community-based clinic model (EBAIS). Hypertension prevention and detection is part of the planned care for adults and carried out in primary care.</li> <li>- Antihypertensive medications are in the list of essential medicines. No co-payment for drugs accessed via the public sector.</li> <li>- Evidence-based national guidelines for hypertension management that is adapted to local resources.</li> </ul>
Cuba	<ul style="list-style-type: none"> <li>- Mean BMI: 26 kg/m<sup>2</sup> in women and 25 kg/m<sup>2</sup> in men, an increase of 1.5-2 kg/m<sup>2</sup> since 1990.</li> <li>- Average sodium intake: ~2.6 g/day.</li> <li>- Availability of vegetables and that of starchy roots and fruits increased since 1990.</li> <li>- Smoking prevalence: 17% in women and 53% in men, a 45% relative reduction in women and 5% in men since 2000.</li> </ul>	<ul style="list-style-type: none"> <li>- Publicly funded health care system with universal coverage. There is no private health care while out-of-pocket expenditures account for ~10% of total health expenditure.</li> <li>- A comprehensive primary health care system has an extensive and well-organised network of primary health care facilities and plentiful workforce throughout the country. 80% of the care is provided at primary care level.</li> <li>- Domestically produced generic antihypertensive medicines are available and prices are kept stable by subsidy from state budget.</li> <li>- Primary-care based national hypertension programme implemented for more than four decades, with updated national clinical guidelines and affordable medications. The programme now</li> </ul>

		<p>includes task sharing among different health care professionals and a registry with performance reporting.</p> <ul style="list-style-type: none"> <li>- The Cuba HEARTS programme was awarded the 2020 World Hypertension League Award.</li> </ul>
Germany	<ul style="list-style-type: none"> <li>- Mean BMI: 26 kg/m<sup>2</sup> in women and 27.5 kg/m<sup>2</sup> in men, an increase of ~1.5 kg/m<sup>2</sup> since 1990.</li> <li>- Average sodium intake: ~3.5 g/day.</li> <li>- Availability of vegetables increased, but availability of starchy roots and fruits decreased slightly since 1990.</li> <li>- Smoking prevalence: 28% in women and 33% in men, a 13% relative reduction in women and 21% in men since 2000.</li> </ul>	<ul style="list-style-type: none"> <li>- 99.9% insurance coverage, with 88% public and 11% private. The healthcare system is funded through 78% compulsory insurance with equal contributions by employer and employee, 7% government schemes, 13% out of pocket and 1% voluntary health insurance.</li> <li>- Free health check-ups, included BP screening, are available for those aged ≥35 years since 1989, and expanded to ≥18 years in 2019.</li> <li>- Payment needed for outpatient prescriptions.</li> <li>- Hypertension guidelines published by ESH/ESC have been used since 2003, which is updated every ~5 years. Since 2003, guidelines recommended immediate treatment for people with BP ≥180/110 mmHg, and treatment after lifestyle modification (unless high CVD risk) for people with BP between 140/90 and 180/110 mmHg. Since 2018, guidelines recommended treatment based on CVD risk for people with BP between 130/85 and 140/90 mmHg.</li> </ul>
South Korea	<ul style="list-style-type: none"> <li>- Mean BMI: 23 kg/m<sup>2</sup> in women and 24.5 kg/m<sup>2</sup> in men, an increase of 0.8 kg/m<sup>2</sup> for women and ~2 kg/m<sup>2</sup> for men, with trends largely flat for women since 2000.</li> <li>- Average sodium intake: ~5.2 g/day.</li> <li>- Availability of vegetables increased greatly, but availability of starchy roots and fruits decreased slightly since 1990.</li> <li>- Smoking prevalence: 6% in women and 41% in men, a 13% relative reduction in women and 35% in men since 2000.</li> </ul>	<ul style="list-style-type: none"> <li>- The healthcare system is funded by 56.5% public resources, 6.7% private insurance and 36.8% out of pocket in 2014.</li> <li>- National Health Insurance system increased coverage from ~25% in 1980 to ~100% in 1989.</li> <li>- A 2000 pharmaceutical policy reform mandated separating drug prescription and dispensing, and increased physician contact.</li> <li>- Co-payment is required for each prescription.</li> <li>- National Health Screening programme started in 1995. It currently covers 97% of adult population and offers free biennial general health screening, including BP check. The participation rate of health screening was 75-80% in 2014-2019.</li> <li>- In some regions, community-based hypertension and diabetes registration and management programmes have been launched since 2012 to improve diagnosis and treatment adherence.</li> <li>- Hypertension guidelines are published by KSH since 2000, with updates every 4-9 years. Since 2004, guidelines recommended immediate treatment for people with BP ≥160/100 mmHg and recommended treatment after lifestyle modification for people with BP between 140/90 and 160/100 mmHg and low CVD risk (immediate treatment for those with medium to high CVD risk).</li> </ul>
Taiwan	<ul style="list-style-type: none"> <li>- Mean BMI: 24 kg/m<sup>2</sup> in women and 25 kg/m<sup>2</sup> in men, an increase of 1-2 kg/m<sup>2</sup> since 1990.</li> <li>- Average sodium intake: ~3.9 g/day.</li> <li>- Availability of vegetables increased greatly, and availability of starchy roots and fruits decreased slightly since 1990.</li> <li>- Smoking prevalence: 3% in women and 19% in men, decreased by 1-3% per year since 1990.</li> </ul>	<ul style="list-style-type: none"> <li>- Single-payer national health insurance system provides universal health care with ~100% coverage since 1996. The costs for clinical visits, medications and monitoring are covered by public funds.</li> <li>- National annual health check-up programmes for elderly population, including county-based integrated preventive service programmes.</li> <li>- Antihypertensive medications can be easily prescribed by physicians and the cost is covered by the insurance systems, including generics and brand drugs.</li> <li>- Academic and professional societies publish hypertensin guidelines since 2010 which are updated regularly, with good uptake among physicians and health professionals. Guidelines recommend treating people with BP ≥140/90 mmHg.</li> </ul>

---

USA	<ul style="list-style-type: none"> <li>- Mean BMI: 29 kg/m<sup>2</sup> in both men and women, an increase of ~2.5 kg/m<sup>2</sup> since 1990.</li> <li>- Average sodium intake: ~3.6 g/day.</li> <li>- Availability of vegetables and of starchy roots and fruits increased since 1990.</li> <li>- Smoking prevalence: 19% in women and 25% in men, a ~30% relative reduction since 2000.</li> </ul>	<ul style="list-style-type: none"> <li>- Public and private insurance covers 80-90% of population. Healthcare is funded 48% by public sources, 40% by private insurance and 12% out of pocket.</li> <li>- Co-payment is dependent on health insurance scheme and service.</li> <li>- Good access to care in the population, although there is a socio-economic gradient.</li> <li>- High awareness of hypertension in the public, through efforts of academic societies and national programmes over the past 3-4 decades, e.g., the National High Blood Pressure Education Program (NHBPEP) since 1972.</li> <li>- Evidence-based, regularly updated hypertension guidelines. Guidelines recommended immediate treatment for people with BP ≥160/110 mmHg in 1993 and lowered threshold to 160/100 mmHg in 1997, regardless of other risks. Since 2003, guidelines recommended treating people with BP between 140/90 and 160/100 mmHg regardless of other risks but after lifestyle modification. Since 2017, guidelines recommended treating people with BP between 130/80 and 140/90 based on CVD risks.</li> </ul>

**Appendix Figure 6.** Proportion of people with hypertension who reported a diagnosis in 2019, and change from 1990 to 2019.

The density plot alongside each map shows the distribution of estimates across countries. The top right panel shows the results ordered within regions and super-regions together with their 95% credible intervals. The bottom right panel shows change from 1990 to 2019 in hypertension detection rates in relation to the uncertainty of the change measured by posterior standard deviation; shaded areas show the posterior probability of an estimated increase or decrease being a true increase or decrease. Each point shows one country. See Appendix Table 3 for numerical results. SD: standard deviation. PP: posterior probability.
